

Automated research and mining of real-life hospital cancer care data

A proposal of functional solution realized in project “Educational platform I-COP”

THIS PROJECT IS SUPPORTED BY THE EUROPEAN SOCIAL FUND AND THE STATE BUDGET OF THE CZECH REPUBLIC.

Presentation is divided into 3 parts

- I. Briefly about the national project “Educational and informative platform for comprehensive cancer centers - CCCs”
- II. Software application support of the project - draft and development of the application for automated research and mining of real-life hospital cancer care data
- III. Predicted possibility of using the application as an information support for screening programs in hospitals (colorectal carcinoma example)

Part I

Project “Educational and informative platform for comprehensive cancer centers”

Project background

- Realization of the project is supported by the European social fund and the state budget of the Czech Republic. This two-year project was started on 1 February 2012.

- Project is lead by the Masaryk University Brno, Institute of Biostatistics and Analyses in cooperation with 13 partner hospitals

- The professional guarantee of this project is the Czech Society for Oncology

Goals of the project

- To build up an educational and informational support for the oncologists
 - Provide workshops, seminars and conferences
 - Central education portal with on-line education materials and live reports will be available on www.icop.cz
 - **Scientific publications and data analyses will be the substantial outcome of the project**
- Bring/reveal new data sources for the oncologists
 - The administrative and epidemiological data about the cancer care in all the partner hospitals will be processed
 - Thanks to the involvement of most of the CCCs, the project will be able to analyze representative portion of national data about cancer care in the Czech republic.
 - **The information support of the CCCs and the new data source will be implemented as a software data warehouse application providing analytical output over the data of involved CCCs**

Part II

Software application support of the project - draft and development of the application for automated research and mining of real-life hospital cancer care data

Real-life hospital cancer care data

- Data from Hospital Information System(s)
 - HIS's differ among CCCs
 - Contains a lot of information in non-parametric form
 - Cooperation of the supplier of the HIS, additional costs for the CCCs
 - Only a supportive role
- Use of the more universal data sources
 - **Medical Insurance Records**
 - **National Cancer Registry**

I-COP DATABASE

I-COP is designed as a tool for information support of physicians caring for cancer patients. Based on data fusion project of the National Cancer Registry and operational-administrative data of the payer health care. Its main ambition is to create an information base that will provide a combined output of these sources and define further analysis and their implementation.

I-COP SOFTWARE

Conceptual draft of the proposed application

I-COP is designed as a tool for information support of physicians caring for cancer patients. Based on data fusion project of the National Cancer Registry and operational-administrative data of the payer health care. Its main ambition is to create an information base that will provide a combined output of these sources and define further analysis and their implementation.

Proposed I-COP components

 **I-COP Database** – integration of clinical information on primary diagnosis and treatment of oncologic patients from the Czech Cancer Registry (CCR) data and administrative data from medical insurance records will allow us to create information-rich merged database that offers completely new perspectives on the process of the oncologic patients' treatment. This designed I-COP database is a fundament for all I-COP tools described bellow.

 **I-COP Reporting** – I-COP Reporting will provide physicians and other hospital workers with a set of predefined, although still customizable views of the I-COP database. These views will be realized through the secure web-based reporting tool and it will primarily offer the basic analyses of patients structure, treatment load and region-related data of given facility. The outcomes could be directly compared with the national reference values.

 **I-COP Browser** – secure web-based tool that will allow advanced users to define their own, very general views of the raw primary data from I-COP database. The primary part of this tool will be designed as a pivot table with defined selectable dimensions. Each group of patients displayed in this pivot table could be selected by variety of filters.

 **I-COP analyses** – the on demand analyses that cannot be implemented directly in the standard I-COP SW tools. These will be prepared as a standalone output focused on the specific topic of the cancer care.

I-COP is designed as a tool for information support of physicians caring for cancer patients. Based on data fusion project of the National Cancer Registry and operational-administrative data of the payer health care. Its main ambition is to create an information base that will provide a combined output of these sources and define further analysis and their implementation.

I-COP REPORTING

[\[Introduction \]](#)
[Epidemiology of cancer](#)
[Detection of diseases](#)
[Patients of Hxx in NOR](#)
[Treatment load of Hxx](#)

I-COP Reporting provides physicians and other hospital workers set of predefined, but customizable views into the database of I-COP. These views are realized through web-based reporting and mainly offer analysis of cancer patients structure, regional related data of given facility and standardized predefined patient information sets compared with average values in the whole country.

Epidemiology of cancer

Descriptive data on the epidemiology of cancer from NOR - incidence, mortality and prevalence in the study population (selected counties or districts).

Detection of diseases

Characteristics of diagnosed patients in the study population - representation of gender, age of the patients, stage detection.

Patients of Hxx in NOR

Characteristics of cancer patients diagnosed, treated or dispensarized in Hxx - regional distribution, representation of diagnosis, stage of disease.

Treatment load of Hxx

Characteristics of cancer patients treated in Hxx (from reported treatment data and NOR) - regional distribution, representation of diagnoses, groups of patients.

Report

Predefined customizable reports will offer the analyses of the processed hospital data. Comparing the specific hospital results with national reference values will be available to evaluate the hospital outcomes.

I-COP is designed as a tool for information support of physicians caring for cancer patients. Based on data fusion project of the National Cancer Registry and operational-administrative data of the payer health care. Its main ambition is to create an information base that will provide a combined output of these sources and define further analysis and their implementation.

I-COP BROWSER

[Introduction]

Oncology patients of Hxx

Treatment of patients of Hxx

I-COP Browser - a tool, which allows the advanced users to define his/her own, very universal views of primary data from the I-COP database. This tool is designed as general contingency table allowing to set any available parameters against each other. Every set of patients analyzed in browser could be qualified by a wide set of available filters. This way, the desired output could be easily acquired and further refined. Prepared outputs could be exported in the MS Excel format.

Oncology patients of Hxx

An analysis of patients with identified relationship to the oncology treatment according to records from NCR or available claims.

Treatment of patients of Hxx

Analysis of treatment process and associated expenses of selected patient from hospital.

© 2011 Institute of Biostatistics and Analyses, Masaryk University

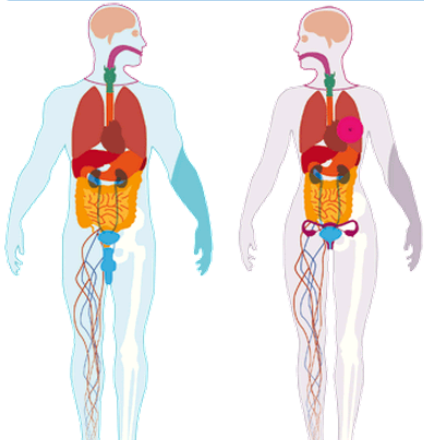

Report name	Description
A: Oncology patients treated in Hxx	Group of patients, for which the records of tumor diagnostics in NCR have been acquired.
B: Patients of Hxx without tumor diagnosis confirmation	Patients with possible oncology treatment in Hxx, but without any tumor record in NCR.
X: Oncology patients of Hxx without recorded treatment	Oncology patients with record assigned to Hxx without any claims in Hxx data.

Report name	Description
Treatment overview of selected patient	Overview of procedures and associated expenses during treatment of selected patient.

I-COP Reporting and I-COP Browser will be both integrated in the same environment of proposed web based application.

Last proposed outcome is a **graph** providing an overview of the applied cancer treatment procedures. The treatment scheme of individual patient could be easily evaluated by oncologists.

Part III

Using I-COP application as an information support for the screening programs in hospitals (colorectal carcinoma screening, short example)

Intra-hospital example

- We want to know:
 - How many screening colonoscopies are performed in our hospital?
 - How many patients with colonoscopy were positive-diagnosed in our hospital?
 - Can we learn more about the positive-diagnosed patients?

Conclusion

- We want to design and develop a flexible educational application, which will be able to process, visualize and analyze the real life hospital data.
- Because most of the CCCs centers participate on this project, we will be able to build up a really robust and representative data source for information support of the oncologists.
- This proposed application will have a potential to be a part of the screening programs as a intra-hospital screening monitor and a data source for the validating data in the screening registries.

KONEC
